Fig. 5

This is a high-contrast, black and white image of a textured surface, likely a rock or mineral specimen. The image is characterized by a dense, granular texture with numerous dark, irregular spots and patches of varying sizes. The overall appearance is mottled and speckled. The image is framed by a thick black border, which is wider on the left and right sides than on the top and bottom. The top and bottom borders are thinner and appear to be part of the original image's edge. The central area of the image is filled with the textured material, with the dark spots being more prominent in the center and becoming sparser towards the edges. The lighting is very high-contrast, with the dark spots appearing as deep black against a lighter, greyish background. The overall effect is one of a rough, uneven surface captured in a stark, monochromatic style.
